

Explain THIS

Governance and Leadership

THIS.Institute

This resource is adapted from 'Governance and Leadership', by Naomi J. Fulop and Angus I. G. Ramsay, part of THIS Institute's series '[Elements of Improving Quality and Safety in Healthcare](#)'.

About the series

Explain THIS is a collection of short, accessible resources designed to help people working in healthcare improvement understand key concepts and approaches. Whether you're new to improvement work or looking to refresh your knowledge, Explain THIS offers clear explanations and links to further resources to support your learning.

Explore the series here:

<https://ths.im/explain-this>

About this resource

This resource offers clear, practical guidance on the key concepts of governance and leadership in healthcare improvement. It defines these terms, and explains how they overlap, operating at multiple levels across the healthcare system to influence quality and safety. The resource also includes practical questions to guide planning, alongside links to further reading for deeper insights. Whether you're starting a new improvement initiative or looking to expand and sustain existing work, this guide provides actionable advice to support your efforts.

Definitions

Healthcare improvement requires strong governance and effective leadership. Together, they shape the conditions in which improvement can thrive, influencing everything from strategic direction to day-to-day culture.

Governance and leadership are overlapping concepts with a complex relationship.

Governance involves the structures and processes that allow oversight, monitoring, and accountability within a system, shaped by formal and informal interactions between those working within that system.

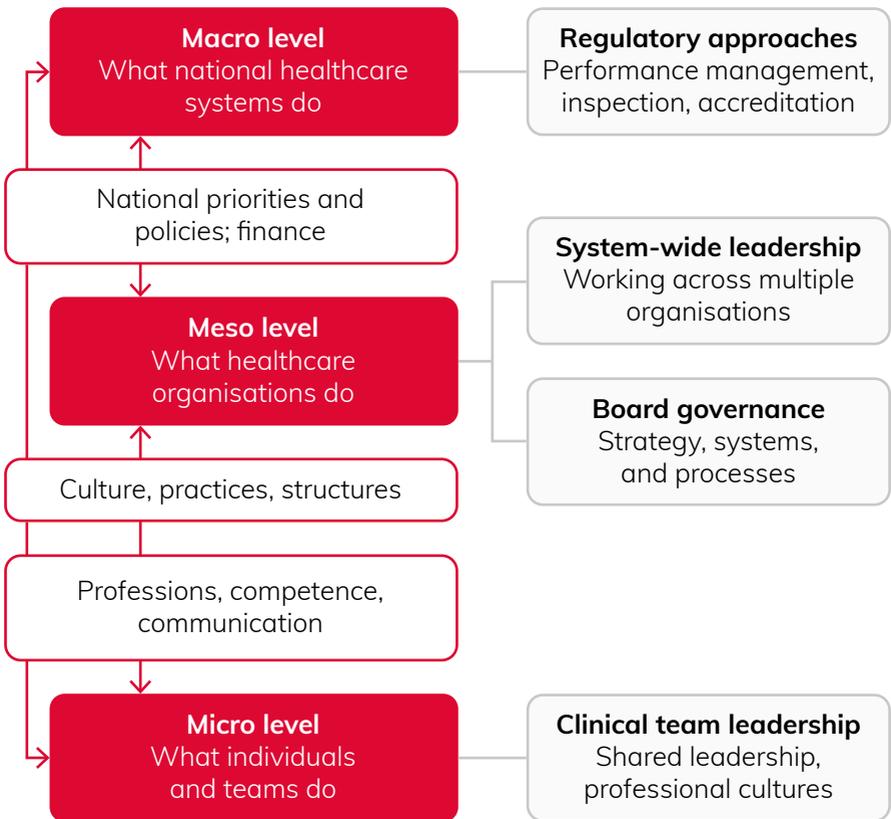

It typically involves:

- Setting a long-term strategy to describe how the organisation's values and priorities will be achieved.
- Ensuring accountability by monitoring and measuring performance.
- Shaping culture and systems to make sure long-term strategies and accountability work effectively.

Leadership can be defined in many ways but is perhaps best summed up as the processes by which individuals or groups are enabled, encouraged, or inspired to achieve agreed goals within a given context.

Governance and leadership operate at multiple levels – known as **macro, meso, and micro** – across the healthcare system. Understanding the interactions between these levels helps with understanding how healthcare can be improved.

For example, at the macro level, a range of bodies may set policies, issue guidance, and allocate resources. Regulators may set standards and put processes in place to oversee them, taking action where needed. At the meso (organisational) level, board governance may try to influence national priorities and to influence within their own organisations. At micro level, clinical and corporate teams work together to deliver care, while responding to potential changes.

How do governance and leadership influence improvement?

Governance and leadership shape how improvement happens in practice. Boards, leaders, and teams can create the conditions for improvement at different levels of the system.

Boards comprise the senior leaders accountable for the quality and safety of care in the organisations they lead. Board governance plays a key role in quality and safety through:

- Setting clear, measurable goals aligned with national and local priorities.
- Ensuring members have a diverse mix of skills and experience.
- Involving stakeholders at all levels in shaping strategic priorities.
- Effective performance measurement and management.
- Using data to inform decisions and drive improvement.

Performance measurement tracks how services perform against targets and standards. While it can improve care, it may also lead to box-ticking, where staff do just enough to achieve the target, or neglect harder-to-measure aspects like a person's individual needs. One way of avoiding this is to give the performance measure an importance ranking so that people don't cherry-pick the measure easiest to achieve.

Performance management involves actively shaping performance, often based on available data. It can drive improvement but may also lead to unintended consequences, such as avoiding high-risk cases that could make performance seem worse. There is also a risk of 'gaming' targets, where services seek to improve only slightly on the previous year's performance, to show superficial improvement.

Leadership has the potential to encourage and facilitate improvement (and the cultures associated with it) at every level. Effective leadership in healthcare improvement typically involves:

- Clearly understanding priorities, external drivers, and local issues.
- Influencing others – experience, technical expertise, extraversion, and conscientiousness are important characteristics for this.
- Engaging a wide range of stakeholders, even those resistant to change.
- Shaping team cultures and behaviours.
- Acting with integrity, fairness, and consistency.
- Recognising when change is needed and taking ownership.

Leadership approaches across systems and teams

At meso level

Different forms of leadership combine to play important roles in delivering major system change.

Leadership approaches to influence major system change

Clinical leadership

A 'bottom-up approach' that helps to ensure well designed systems supported by the people who will deliver them.

Region-wide leadership

A 'top-down approach' that encourages stakeholders (clinicians, payer organisations, patients, and the public) to remain engaged in discussions around the change process.

Examples:

- London reorganised its stroke services by combining top-down leadership from health authorities with bottom-up input from clinical experts. This combination resulted in system-wide ownership of the changes, which helped to overcome local resistance.
- London Cancer, a network of provider organisations, was established using several processes to support delivery of change – a consistent core leadership team, sharing responsibility with clinicians and managers across different levels of the system, and engaging actively with stakeholders.

At micro level

Leadership is central to building team cultures and behaviours that support high-quality, safe care, including creating psychological safety (where team members feel safe to speak up). One useful way of thinking about team leadership is to consider its focus – for example, on the people in the team, and on the tasks to be achieved.

Leadership approaches to influence teams

Person-focused leadership

- Engages and inspires team members to work together.
- Focuses on the individual needs of team members, providing constructive feedback and development opportunities.
- Enables each team member's skills to improve, helping them feel valued and increasing their sense of belonging and ownership of team goals.
- May become more complex when teams cover more than one profession or sector.

Task-focused leadership

- Relates to the process by which team goals are achieved.
- A shared sense of objectives, responsibilities, and delivery helps to ensure that all team members are working to the same quality goals.

Top tips for governance and leadership

At macro level (national)

Use incentives carefully

Incentives can drive change but may have unintended consequences. Involve people managing, delivering, and using services in developing incentive systems.

Consider practical and emotional burdens

Make sure the right resources (people, capacity, time) are in place to deal with the practical and emotional burdens associated with improvement efforts.

Micro level (clinical teams)

Use person-centred leadership

Leaders should focus on individuals' needs and aspirations. Constructive feedback enhances team skills, sense of value, and encourages ownership of team priorities.

Use task-centred leadership

Establish shared objectives, responsibilities, and ownership for quality within teams. This promotes a culture of collaboration, psychological safety, and innovation.

Meso level (systems and organisations)

Prioritise quality and safety

This should be a central priority for boards. Include them on agendas, use data to support understanding of quality and safety, and dedicate resources to building expertise in these areas.

Build a case for quality

Leaders should use both hard data (such as performance metrics) and soft data (such as patient stories) to make a compelling case for improving quality and building an improvement culture.

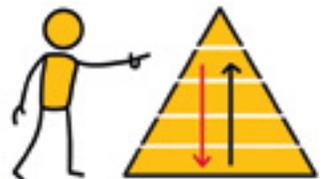

Learn from others

Boards should be open to building networks with and learning from external organisations to improve their own approaches to quality and safety.

Combine approaches

Making large-scale improvements requires combining both top-down leadership (from the board) and bottom-up approaches (from frontline staff).
