

Top tips for Implementation science

Select your framework or theory

Choosing the right one for your intervention is not always easy. Start by thinking about the change you want to see, how a particular approach might work in your setting, and what has worked well in the past.

Choose your practical strategies

There are lots of strategies you can use to bring about change. Individually these may have modest impact but can be more effective when used in combination.

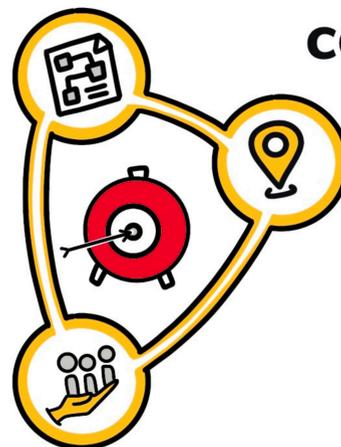

Don't overlook challenges

Challenges may arise that aren't covered by your chosen theory or framework. Be prepared to consider a broad range of approaches to tackle these.

Consider the context

Think about the wider environment where the implementation will be carried out. This could include things such as physical setting, resources available, policies, and culture.

Be prepared to adapt

Health systems are not fixed structures, they are constantly evolving and adapting. You may also need to adjust your approach in response to insights and learnings that emerge from your implementation work.
